Task # 1:

Make and APIs for crud operation for This Record .

{

        _id: objectId,
        breed: String,
        live_weight: Number,
        animal_image: String

}

APIs must be fulfilling the following criteria :
1) Add record API , In which user enters breed , live_weight , and animal_image .
   a) You have to add a check on the breed attribute . If the breed is ['cholistani' , 'nili ravi'], one of these . then allow user to enter record , otherwise send response to user that ,"breed must be cholistani Or nili ravi"
   b) API must get an image of an animal and store it on the server , and then store the path of that image in the database in 'animal_image' attribute' .

2) Get animal record by id : In API , user must enter _id of the animal record and in response API must fetch the stored record of animal according to _id you entered . API should return all data of animals .

For image uploading , Follow any tutorial on youtube . Please read the documentation of npm package 'multer' for better understanding.
